

# Vision in Motion

## South End of Facility

### What is happening at the south end of the conversion facility?

Vision in Motion (VIM) is an important project Cameco is undertaking at its Port Hope conversion facility. Cameco will engage in clean-up and renewal activities that will improve the look and efficiency of the site and address legacy waste at the Port Hope Conversion Facility that was inherited from historic operations.

An important part of the Vision in Motion project is reducing the conversion facility's land footprint by seven acres and providing the public more access to the harbour. Certain activities and changes planned to occur at the south end of the Port Hope Conversion Facility are an integral part of this.

Work has already begun at the south end of the facility.

Cameco is relocating empty storage cylinders to provide room for a new hydrogen station. Construction of this hydrogen station will be completed within our fence line.

Additional activities occurring at the south end of the facility will include remediating some of the lands between the fence line and the waterfront, and infrastructure enhancements, such as improvements to the storm water management systems.

These changes at the south end of our conversion facility site allow Cameco to shift its southernmost fence line northward approximately 15 metres. This shift in our fence line helps fulfill the commitment to reduce our footprint and provides the public with more access to the southern end of the harbour.

*Cameco plans to shift its fence line at the south end of the facility which reduces our facility's footprint and provides the public with more access to the harbour and the west beach.*
